

FACT:

INMATES AT YOUR FACILITY ARE USING YOUR INMATE TELEPHONES TO TALK TO OTHER INMATES.

Inmate-to-inmate phone calls have been invisible to correctional facility investigators, making them a security threat that has been impossible to detect.

Some correctional facilities know that the potentially dangerous communications exist but do not have the resources to track them and stop them; others either don't know about these phone calls or simply don't believe they are possible. And no one could assess the frequency or severity of the problem.

Until now.

ICER™ is the most effective system available today for detecting inmate-to-inmate communications and proactively alerting authorized facility staff, helping them control and stop crimes committed by inmates from behind bars.

Inmate-to-Inmate Calling: The “Invisible” Security Threat

HOW ICER™ WORKS

ICER™ listens to every every call that originates from every facility where the system is deployed, creating unique call “signatures”. Then, using patented, state-of-the-art technology, ICER™ finds pairs of calls in which the unique call signature is found on both to identify inmate-to inmate communications wherever and whenever they happen.

Thanks to ICER™, facilities are now uncovering events both within their own facility and between different facilities across the country, all across the country.

FACT:

Every call is facilitated by a third party. Only ICER™ by **JLG Technologies** has the ability to help corrections staff identify and **stop illegal inmate-to-inmate communications.**

How Illegal Calls Happen

1. Called party executes **3-way calling**
2. Called party **manually bridges** calls
3. Called party uses **automatic bridges**
4. Called party uses **speaker phones**, putting the two phones side by side
5. Called party **relays messages** in real time
